Digital forensics investigations play a key role in protecting an organisation's intellectual property.

Protection of intelectual property, business plans and confidential information is of vital significance, not only for company's development, but also for its survival in the modern and competitive market.

Unlike „traditional" espionage which is being conducted for national security purposes, the practice of collecting confidential information for commercial or financional purposes, without it's owner's knowledge, is called industrial or business espionage.

Insider Threat is most often defined as a security threat which comes from the organisation which is being under attack or aimed at. Mostly it is about an employee or a high ranked official.
That kind of „insider" attacks are more probable and dangerous than many other types of attacks and most often pass under the radar of the standard security checks. The stolen information is usually used against the company when the former employee finds new employment in the competitor's company or if the former employee decides to form a new company.

Technical Surveillance Countermeasures (TSCM), also known as bug sweep, is a highly specialized and comprehensive service that detects special technical means (Eavesdropping /Surveillance Devices) for surreptitious information gathering.

Mobile device forensics as one of the branches of digital forensics has become indispensable in corporate inquiries because mobile phones usually represent crucial and only irrefutable proofs of some activity, abuse or a felony.

Oxygen Forensic Detective is an advanced forensics software which we have been using for years. We have solved numerous corporate investigations thanks to the OFD.

Oxygen Forensic Detective is not developed only for mobile forensics. It is a powerful tool for forensic investigation of PC/MacOS/Linux computers as well.

In our recent investigation, we've just discovered a intellectual property theft, more exactly an unauthorized copying of proprietary data to the user's external media thanks to the Oxygen KeyScout tool.
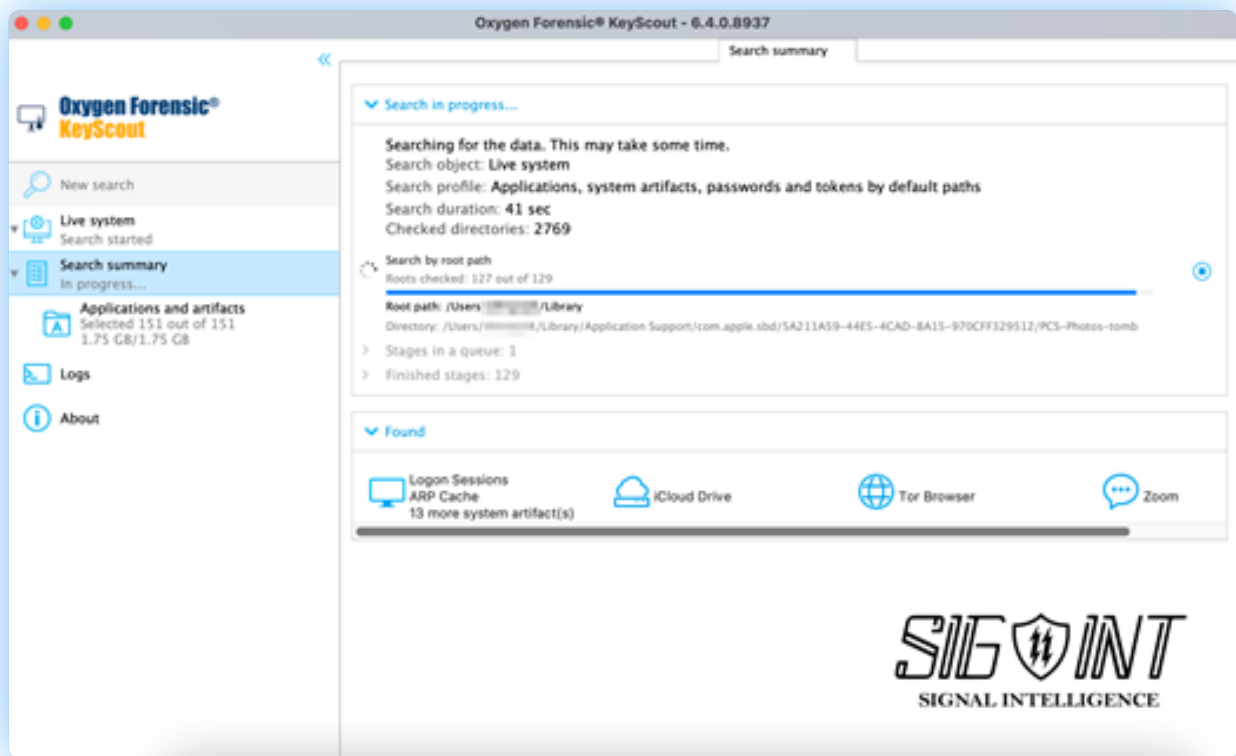

Oxygen Forensic Detective is, based on our many years of experience, the best possible choice for companies which deal with corporate security. With this software you are getting an integrated multi-functional tool for digital forensics which you can use to overcome challenges without additional costs, and all that for a very reasonable pricing.

About the Reviewer

Signal Intelligence Ltd. is the only company in Croatia which is narrowly specialized for conducting and analyzibd. By giving advises, guidelines and analysis of information helping clients in risk management and protection of their reputation.
